WISE SECURITY GLOBAL

CyberSECURITY

CSOC

CYBERSECURITY OPERATION CENTER

Security event management and monitoring

WISE Security Global has set up its **solution to manage security** events through its own threat detection service, in order to prevent any type of attack or security incident **This solution includes services operated from our CSOC / CERT with innovative strategies and technology.**

Monitoring and correlation of security systems is not sufficient to achieve the highest level of protection. Manual analysis of security events in computer systems improves security capabilities, filtering out false positives and identifying risks that may lead to security incidents.

- ❑ Passive and active network monitoring.
- ❑ Detection and alert generation of suspicious events/activities.
- ❑ Attack prevention and reinforcement of digital security.
- ❑ CSOC's support to execute actions aiming to prevent/respond incidents.
- ❑ Design, provision, deployment, administration and support of SIEM systems.
- ❑ Highly skilled and trained cybersecurity team.

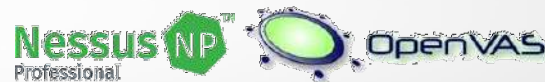

CYBERSECURITY OPERATION CENTER

Vulnerability management

WISE Security's vulnerability management refers to the process of **discovering, confirming, classifying, prioritizing, assigning, remediating, and tracking vulnerabilities**.

WISE Security helps companies to detect and mitigate risks through its **vulnerability management solution**, that seeks to maximize data protection, through integrated vulnerability management system, minimizing risks of exposed systems, networks and equipment.

- ❑ Vulnerability scanning and maintenance of optimal levels of information security
- ❑ Vulnerability management of networks, equipment, systems and people.
- ❑ Support from Wise Security competence center to take actions against vulnerabilities.
- ❑ Identification of updating and patching needs of systems that make up company's security platform.

CYBERSECURITY OPERATION CENTER

Early threat detection

Being aware of today's cyber security issues is a time-saver in risk prevention and management.

WISE Security Global offers real-time security information and alerts to our customers

- ❑ Timely and effective attention to security events.
- ❑ Access to first-hand security information through CSOC/CERT affiliation, from recognized security incident early warning organizations.
- ❑ Information recovery which has been deleted or affected in incidents.
- ❑ Detection of any attack attempt due to constant monitoring of organization's assets.
- ❑ Continuous monitoring to prevent major impact derived from incidents.

■ ■ ■ CYBERSECURITY OPERATION CENTER

Malware analysis

With the increasing number of targeted attacks, organizations must raise their security levels. Tailor-made malware can carry out cyber espionage or sabotage work, causing significant damage to organizations.

WISE Security Global provides its malware analysis solution to examine the characteristics and capabilities of malware and focus efforts on preventing future incidents and taking effective action.

- ❑ Identification of the malware's traits, such as the scope of the actions it can execute on the system, as well as its propagation.
- ❑ Prevention of malware attacks due to our CSOC / CERT's prior knowledge of new forms of malware.
- ❑ Effective and timely response to any malware incident detected.

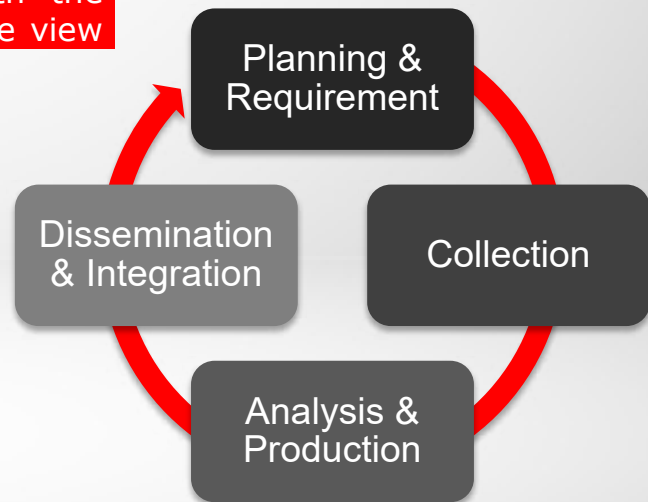

CYBERSECURITY OPERATION CENTER

Threat intelligence

The proactive defense based on emerging risk information is today a real need. WISE Security's Threat Intelligence consist in knowing, understanding and outlining the clients' adversaries in order to anticipate and detect them, by correlating the internal and external information get from the monitored system.

The technological experience of WISE Security has allowed to develop its own system of automation and correlation of sources, which, with the information gathered by the security monitoring devices, gives an agile view of threats that may affect our clients.

- ❑ Proactive detection of attacks that may threaten the brand, key services or organization reputation.
- ❑ Evaluation of institutional brand or service in relation to customers or users on the Internet.
- ❑ Detection of fraudulent applications and websites that may put customer and its stakeholders at risk.
- ❑ Localization of activities susceptible to become fraudulent actions.
